A handful of online tools now let you create, save, and share Photoshop layer files, which could replace layers in Photoshop. See Chapter 14 for more on shared Photoshop files. Book I has a chapter that takes an in-depth look at a number of Photoshop's features, including the basic understanding of layers and how to manipulate them. Introducing Photoshop's features This book can't tell you everything about Photoshop, as you'd have to read a book 50 times as long to cover every feature. This chapter focuses on the basics to help you figure out how Photoshop works. Most other chapters get specific, but this chapter gives you a basic understanding of how Photoshop works. After all, when you're first picking up a new tool, you need to know how it works. Another reason that I cover the basics is to help you appreciate and understand the way you use and manipulate layers. Appreciating the power of layers comes with experience. Unlike other tools, Photoshop gives you at least two tools for manipulating the final version of an image — layers and channels. This section shows you how to organize images and add and manipulate layers. The next section takes you through channels in more detail. Organizing images After you load an image into Photoshop, it becomes a layer in your active Photoshop workspace (the one you're using to work on the image). Figure 11-1 shows three layers that have been added to my document window. **Figure 11-1:** You can load images into Photoshop as layers. Creating and using layers Photoshop layers enable you to manipulate your images and save them in a number of different formats. You can even create your own layers and use them for your own purposes. You can create layers in Photoshop in a number of different ways, including these: Creating a new layer: Using the New Layer command, a new layer is added to your active editing window. Select Layer⇒New Layer, or press Ctrl+N (Windows) or Command+N (Mac OS). Merging layers: The Layer⇒Merge Down command merges the contents of one layer with the contents of the active layer below it. The contents of the active layer are duplicated above the active layer. The new, merged layer is displayed below the active layer. Select Layer⇒Merge Down, or press Ctrl+M (Windows) or Command+M (Mac OS). Using an existing layer

Q: .htaccess HTTPS redirect 301 to HTTPS and HTTP redirect to HTTP I have just purchased a SSL certificate on GoDaddy and have added the A record to DNS pointing to my server. I've written some code to do a 301 redirect to https when a user clicks on a link on http to https but it does not work and is causing an error when the user comes back to the main page. Here is the code I have written in my.htaccess. Is there something I am missing? Options +FollowSymLinks RewriteEngine On RewriteCond %{HTTPS}!=on RewriteRule ^(.*) [R=301,L] A: Your code is correct and should work (at least it works for me). You can test it from your browser by typing this URL in: and then if you are using Firefox: FireBug + F12 or just by going to: Just to debug your issue, try to change your redirect: RewriteRule ^(.*) [R=301,L] to something like this: RewriteCond %{HTTPS} off [OR] RewriteCond %{HTTP_HOST}!^www\.[NC,OR] RewriteCond %{HTTP_HOST} ^(?:www\.)?(.+)\$ [NC] RewriteRule ^ [L,R=301] Test the 1st rule, without the 2nd and 3rd rule to make sure that is the problem. Just a suggestion: if you want to use your SSL certificate for all your site pages, and serve both HTTP and HTTPS content, I would recommend: change your port from 443 to 80 (this is for test purposes only, as you need to open the port in your firewall) change your document root from /some/path/site/ to /some/path You should be able to serve both HTTP and HTTPS content via a normal Apache server, so you don't need to use the SSL certificate for all your site content.
